Search Notes

Examiner Epps-Ford,

Here are the results for your recent search request.

Please feel free to contact me if you have any questions about these results.

Thank you for using STIC services. We appreciate the opportunity to serve you.

Sincerely,

Mary Jane Ruhl Technical Information Specialist STIC Remsen 1-A-62 Ext. 22524

New antisense oligonucleotides inhibiting the anti-apoptotic protein bel-xL, useful for reducing bel-xL production in tumor cells to treat cancer or in vascular cells to promote the regression of vascular lesions.

Claim 1; Fig 1; 69pp; English

which reduce or eliminate expression of the anti-apoptotic protein bellat. The oligonucleotides can be introduced into tumour cells to reduce bcl-xL production to treat cancer, especially epithelial cancer, e.g. prostate, lung or bladder cancer. Oligonucleotides comprising one or more bases with a C-5 propynyl pyrimidine modification may especially be used to reduce levels of boll-2 family proteins (to which bcl-xL belongs) in such treatment. The oligonucleotides can be introduced into vascular cells to reduce bcl-xL production to promote the regression of vascular The invention provides antisense oligonucleotides or their derivatives

```
ö
lesions. They can also be included with a carrier (and optionally tetra meso-(4-methylpyridyl)porphine and/or tetra meso- (anilinium)porphine; in pharmaceutical compositions, useful as above. Sequences AAZ46971-983 represent antisense oligos specific for the bcl-Xl mRNA
                                                                                                                                                                                                                                                                                           Gaps

human New human genome-derived single exon nucleic acid probes useful for huma gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 15; SEQ ID NO 7084; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human gene expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above- mentioned amino acid soft any of the above- mentioned amino acid soft sequences (optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing

human gene expression data by subscription, and a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying crissues to detect the probes are used in identifying and characterising in addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising gross alternative splicing events, in detecting and characterising substractions in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human called form part of the primited specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                .;

```
The present invention describes a method (M1) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also determining the presence of a toxic response to the agent. Also determining the presence of a toxic response to the agent. Also cash the service of a toxic response penes corresponding to the partial sequences given in ABZ82842 to ABZ84764, or their fragments of at least 20 nucleotides, or homologues cresponse gene plays a role on toxic response pathways by determining the espension profile of the gene after exposine of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: (a) expositing cells to an agent or isolating cells from a human subject who was exposed to an agent or isolating the test gene expression profile for a putetively identified toxic response gene after exposure to a known coxic pharmaceutical or industrial agent; and (c) comparing the test comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of the methods are useful for
                                                                                                                                                                                                                          ö
protein, particularly with pcmV plasmids as vectors for expression in mammalian cell cultures. The protein has particular application in cancer cells (failure of programed cell death (PCD)) or neurodegenerative and autoimmune diseases (premature PCD), e.g. Parkinson's disease, amylotrophic lateral sclerosis and multiple sclerosis. (Updated on 25-MAR -2003 to correct PN field.)

The invention relates to a composition comprising a plurality of CDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic conditions to form one or more hybridisation complexes, detecting the nucleic conditions to form one or more hybridisation complexes and comparing the levels of the detected hybridisation complexes with the level of hybridisation complexes with the level of hybridisation complexes orderelates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a method for identifying a plurality of polynucleotide probes. The cDNAs are useful as hybridisable array elements in a microarray for monitoring the expression of target polynucleotides. The microarray for monitoring the diagnosis of an immunopathology, such as Crohn's disease, asthma, clearive colitis, hypereoinophilia, irritable bowel syndrome, osteoarthritis, rheumatoid arthritis or acute monocytic leukaemia, and in

The host cell comprises a hamster or a murine myeloma cell that is genetically modified by introduction of nucleic acid sequences encoding an anti-apoptosis gene, a selectable amplifiable marker gene and at least one gene of interest. The host cell of the invention may be useful for producing at least one protein encoded by a gene of interest. The DNA, polypeptide and the methods may be used for inhibiting or delaying cell death. The current sequence is that of the Chinese hamster anti-apoptosis bcl-xL wild-type DNA of the invention.
identifying agents for the treatment of the diseases. The microarray may also be used in drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. The composition may also be used in purification of a subpopulation of mRNAs, cDNAs or genomic fragments. This sequence represents a human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New genetically engineered hamster or murine myeloma host cells comprising enhanced levels of active anti-apoptosis genes, useful for producing complex protein therapeutics.
                                                                                                                                                                                                                                            Gaps

The protein has particular application in cancer cells (failure of programed cell death (PCD)) or neurodegenerative and autoimmune diseases (premature PCD), e.g. Parkinson's disease, amylotrophic lateral sclerosis and multiple sclerosis. Antisense inhibition of bcl-x and bcl-xs expression results in apoptosis. Antisense oligonucleotides directed against bcl-x alter the ratio of bcl-x is foromas expressed by a cell or tissue (i.e. increases or decreases the ratio of bcl-xl to bcl-xs expressed) by altering the splicing of the RNA encoding bcl-x. The antisense oligonucleotide is specifically targeted to a transcript comprising two splice sites which when contacted with the transcript, reduces the relative frequency of splicing at the second splice site so that the resulting ratio of RNA splice products is altered. The use of antisense compounds sensitises cells to the effects of apoptotic stimulants such as a cellular signaling molecule, ultraviolet radiation, a cancer chemotherapeutic drug (e.g. VP-16, cisplatinum or taxol), ceramide (e.g. staurosporine) or a cytokine which causes mitochondrial dysfunction (especially loss of mitochondrial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes human bcl-XL protein, which protects T-lymphocytes against cell death. The genomic bcl-X gene may produce 2 different mRNAB, one encoding a long form (bcl-XL), the other a short form (bcl-XS), can encoding a long form (bcl-XL), the other a short form (bcl-XS), can be a short form bcl-XB.

Coding exon to a more proximal 5'-splice donor within the lst coding coding exon to a more proximal 5'-splice donor within the lst coding coding exon to a more proximal 5'-splice donor within the lst coding coding exon to a more proximal 5'-splice donor within the lst coding coding exon to use the bcl-XL conversion. The gene may be confinible interaction with antagonistic Bad protein, by modification of the Bcl-X homology domains BHI and/or BHZ. The bcl-XL gene may be introduced into T-cells in vivo or ex vivo via gene transfer using a vector for HIV infection gene therapy, to augment intracellular bcl-XL protein levels and protect from cell death. A corresponding antisense oligonucleotide or expression vector may be used in gene therapy of e.g. autoimmune disease, graft rejection or graft-versus-host disease, to induce cell death (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing or preventing death of T cells by bcl-XL protein regulation used to increase survival of HIV infected cells or to down:regulate immune responses in immune diseases.

Controlling cell behavior, useful e.g. for treatment of tumors, by modulating processing, e.g. splicing, of specific mRNA sequences with non-cleaving antisense agents.
                                                                                                                                                                                                                                                                                                                                                                             The invention relates to controlling cell behaviour by modulating the processing of a selected wild-type mRNA target in the cell, is new. The mRNA is bound to a specific-binding antisense compound that does not cleave bound mRNA. The antisense oligonucleotides are useful as research reagents, diagnostic agents (in hybridisation assays), and for treatment or prevention of diseases, e.g. to prevent or delay infections, inflammation and tumours. The present sequence is the cDNA for the human bcl-x which is a target for antisense oligonucleotides if the invention
                                                                                                                                                                                                                                Monia BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

inhibitor or an apoptosis promoter in which VDAC-liposome, an index substance which can pass VDAC and a sample are incubated and the change in the concentration of the index substance during the incubation is detected to judge the presence of apoptosis inhibition or apoptosis promotion. The apoptosis inhibitor or the apoptosis promoter can be used as a drug and a diagnostic agent for various diseases caused by apoptosis inhibition or apoptosis promotion. The present sequence encodes the human Bcl-xL protein, which is an apoptosis inhibitor used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.
                                                                                                                                                            present invention describes a method for screening for an apoptosis
                                                  drug and a diagnostic agent for various diseases caused by apoptosis inhibition or apoptosis promotion.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to detecting (M1) granulocyte (GC) activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, ss; granulocytic cell; DNA chip; bacterial infection; viral infection; parasitic infection; protozcal infection; fungal infection; sterile inflammatory disease; psoriasis; rhematoid arthritis; glomerulonephritis; acthma; thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS; adult respiratory distress syndrome; inflammatory bowel disease; Crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.

CGCAA), by detecting the level of expression of gene(s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC. where differential expression of Gs is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression of the gene is indicative of inflammation; (4) treating (M5) an inflammatory disease, by contacting a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammation disease, by contacting a tissue having inflammation with an agent capable of modulating GA, M3 is useful for detecting GCA, M2 is useful for modulating GA, M3 is useful for detecting an agent capable of modulating GA, m3 is useful for detecting an attissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammation disease, inflammation disease, m4 is useful for detecting an inflammatory disease, or subject to a pathogen or sterile inflammation for subject, exposure of a subject to a pathogen or sterile inflammation and tissue, m4 is useful for detecting an inflammatory disease, contacting an inflammatory disease, condition, viral infection, parasitic infection, protozoal infection, creption and m3 is useful for reatine gene differentially conditions. The present sequence represents a gene of the above conditions. The present expersence in a subject in the present 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a DNazyme which specifically cleaves mRNA transcribed from a member of the bcl.2 gene family. The DNazymes comprise a catalytic domain, binding domains contiguous with the 5' and 3' end of the catalytic domain, and therefore hybridise with, the two regions immediately flanking the purine residue of the cleavage site within the bcl.2 gene family mRNA, at which DNAzyme-catalysed cleavage site within the branaceutical composition comprising a DNAzyme of the invention is useful for treating tumours in a subject, and for enhancing the sensitivity of malignant or virus infected cells infected cells to therapy. The DNAzymes are useful in diagnostics, therapeutics, prophylaxis, research agents and in kits. The DNAzymes are also useful to increasing the susceptibility of tumour cells to anti-tumour therapies such as chemotherapy and radiation therapy. This polynucleotide sequence represents a human bcl-2 gene of the invention
                                  Novel DNAzyme useful for treating tumors, and for enhancing the sensitivity of malignant or virus infected cells to therapy, comprises catalytic domain and binding domain contiguous to the catalytic domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a hamster host cell or a murine myeloma cell genetically modified by introducing nucleic acid sequences that encode for an anti-apoptosis gene, a selectable amplifiable marker gene or at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New genetically modified host cells comprising nucleic acid sequences that encode for an anti-apoptosis gene, a selectable amplifiable markegene or at least one gene, useful for producing biopharmaceutical

                      least one protein encoded by a gene of interest, particularly for the production of biopharmaceutical proteins. The genetically engineered host cells have improved survival properties and enhanced level of active anti-apoptosis genes compared to non-transfected as well as non-amplified parental cells. The current sequence represents a bcl-xL nucleic acid

```

The present invention relates to methods for modulating the expression of bcl-x. The invention is useful for sensitising cancer cells such as

Claim 1; SEQ ID NO 1; Opp; English

```
ô
glioblastoma and leukaemia to an apoptotic stimulus (e.g. ultraviolet radiation, cancer chemotherapeutic drug (e.g. cisplatinum). The invention is useful for treating acquired immune deficiency syndrome (AIDS), neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, epilepsy and ischaemia such as myocardial infarction and stroke. The present sequence is human bcl-x DNA
                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense inhibition of bcl-x and bcl-xs expression results in apoptosis. Antisense oligonucleotides directed against bcl-x alter the ratio of bcl-x is offerms expressed by a cell or tissue (i.e. increases or decreases the ratio of bcl-xl to bcl-xs expressed) by altering the splicing of the RNA encoding bcl-x. The antisense oligonucleotide is specifically targeted to a transcript comprising two splice sites which when contacted with the transcript, reduces the relative frequency of splicing at the second splice site so that the realiting ratio of RNA splicing at the second altered. The use of antisense compounds sensitises cells to the effects of apoptotic stimulants such as a cellular signaling molecule, ultraviolet radiation, a cancer chemotherapeutic drug (e.g. VP-16, cisplainum or taxol), ceramide (e.g. staurosporine) or a cycokine which causes mitochondrial dysfunction (especially loss of mitochondrial
lesions. They can also be included with a carrier (and optionally tetra meso-(4-methylpytyidyl)porphine and/or tetra meso- (antihium)porphine; in pharmaceutical compositions, useful as above. Sequences ARZ46971-983 represent antisense oligos specific for the bcl-X1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             function). The antisense oligonucleotides may have a therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Controlling cell behavior, useful e.g. for treatment of tumors, by modulating processing, e.g. splicing, of specific mRNA sequences with non cleaving antisense agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to controlling cell behaviour by modulating the processing of a selected wild-type mRNA target in the cell, is new. The mRNA is bound to a specific-binding antisense compound that does not cleave bound mRNA. The antisense oligonucleotides are useful as research reagents, diagnostic agents (in hybridisation assays), and for treatment or prevention of diseases, e.g. to prevent or delay infections, inflammation and tumours. The present sequence is an antisense oligonucleotide which targets the gene for human bcl-x
                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "2' methoxyethoxy residues when 16-20 are also 2' methoxyethoxy residues. All cytosines in this region are also 5-methyl-cytosine"

expression of bcl-x in human cells or tissues through antisense inhibition by the antisense oligonucleotides. An antisense compound containing the oligonucleotide together with a chemotherapeutic agent is useful for preventing or treating tumour formation. The antisense compound is also useful for treating tumour formation infection or inflammation. Cancer particularly glioblastoma and leukaemia, autoimmune disorders and viral infections, AllS, neurodegenerative disorders like Alzheimer's or Parkinson's diseases may be treated using compounds containing the antisense oligonucleotides. The present sequence represents an antisense oligonucleotide targeted against a region of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note== "nucleotides 1-5 and 16-20 are 2'-methoxyethoxy (2'MOE); all 2'MOE cytosines are 5-methyl-cytosines; all linkages are phosphorothioate"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Controlling cell behavior by modulating mRNA modification, useful in therapeutics and as research tool, comprises using antisense oligonucleotide which hybridize to mRNA and block modification regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to the control of cell behaviour by modulating the processing of a wild-type mRNA target, comprising binding to the target does not antisense compound which specifically hybridises to the target and does not elicit cleavage of the mRNA upon binding. The method of the invention can be used in therapeutics (i.e antisense therapy), including prophylaxis, and as a research tool. It is used for controlling the behaviour of a cell (especially responses such as apoptoasis, mitosis, differentiation and quiescence to stimuli such as stress, hormones, cytokines and other signalling molecules), tissue or organism through a human bcl-x equence represents a human bcl-x exon 1/exon 2 antisense oligonucleotide designated SEQ ID 42, designed to target areas of exon 1 and exon 2 of human bcl-x, particularly around the exon 1/exon 2 splice site and in sequence regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating diseases with oligonucleotides or interfering RNA, useful e.g. for cancer or autoimmune diseases, covalently coupled to mobile proteins,

The present invention describes a method for treating a disease by administering: (a) a therapeutic oligonuclectide (TON) or double-stranded RANA (EMRNA) that includes a reactive group (RG) that can react with a combine protein (MP) to form a covalent conjugate of TON/dsRNA and MP; or Gescribed: (1) TON of 15-30 bases that includes (1) a part that binds to target RNA or DNA and (15-30 bases that includes a part that binds to target RNA or DNA and is conjugated to MP through a covalent link; (3) dsRNA that includes RG; and (4) dsRNA that is conjugated to MP through a covalent link. TON have Cytostatic, immunosuppressive, virucide, anti-HIV, antibacterial and cardiant conjugated to MP through a covalent link and particularly cancers, solid or haematological, including prevention of particularly cancers, solid or haematological, including prevention of metastatic spread); autoimmune diseases, viral or bacterial infections; candorrine, neural, cardiavascular, pulmonary or reproductive system disorders Also where TON or dsRNA are labelled, they can be used for disorders and monitoring of therapy. When linked to a mobile protein, conjugances (1) increased resistance to nuclease), without loss of affinity for the target. In many cases immune response to TON/dsRNA is also reduced, as is non-specific binding to endogenous proteins. The present sequence represents a human bol-xl antisense conjugantical proteins. The present sequence represents a human bol-xl antisense

The present invention relates to methods for modulating the expression of bcl-x. The invention is useful for sensitising cancer cells such as glioblastoma and leukaemia to an apoptotic stimulus (e.g. ultraviolet radiation, cancer chemotherapeutic drug (e.g. cisplatinum). The invention is useful for treating acquired immune deficiency syndrome (ALDS), neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, epilepsy and ischaemia such as myocardial infarction and stroke. The present sequence is human bcl-x antisense oligonucleotide. This sequence is the analogue of ISIS 15599
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compound useful for treating reduced apoptotic conditions e.g. cancer comprises nucleobases targeted to nucleic acid molecule encoding human gene encoding intracellular membrane protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           용
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to methods for modulating the expression of bolls. The invention is useful for sensitising cancer cells such as glioblastoma and leukaemia to am apoptotic stimulus (e.g. ultraviolet radiation, cancer chemotherapeutic drug (e.g. cisplatinum). The invention is useful for treating acquired immune deficiency syndrome (AIDS), neurodegenerative disorders such as Alrhemer's disease, Parkinson's disease, amyotrophic lateral sclerosis; retinitis pigmentosa, epilepsy and ischaemia such as myocardial infarction and stroke. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; bcl-x; glioblastoma; leukaemia; chemotherapy; epilepsy; ischaemia; retinitis pigmentosa; myocardial infarction; neuroprotective; cytostatic; Alzheimer.'s disease; Parkinson's disease; amyotrophic lateral sclerosis; acquired immune deficiency syndrome; neurodegenerative disorder; AIDS; nootropic; anticonvulsant; vasotropic; therapy; cerebroprotective; stroke; antisense; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compound useful for treating reduced apoptotic conditions e.g. cancer comprises nucleobases targeted to nucleic acid molecule encoding human gene encoding intracellular membrane protein.

The present invention relates to methods for modulating the expression of bcl-x. The invention is useful for sensitising cancer cells such as glioblastoma and leukaemia to an apoptotic stimulus (e.g. ultraviolet radiation, cancer chemotherapeutic drug (e.g. cisplatinum). The invention is useful for treating acquired immune deficiency syndrome (AIDS), neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, epilepsy and ischaemia such as myocardial infarction and stroke. The present sequence is human bcl-x antisense oligonucleotide. This sequence is the analogue of ISIS 15999
                                                               retinitis pigmentosa, myocardial infarction, neuroprotective, cytostatic, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis; acquired immune deficiency syndrome, neurodegenerative disorder, AIDS; nootropic, anticonvulsant, vasotropic, therapy, cerebroprotective; stroke, antisense, phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Compound useful for treating reduced apoptotic conditions e.g. cancer comprises nucleobases targeted to nucleic acid molecule encoding human gene encoding intracellular membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to methods for modulating the expression of bcl-x. The invention is useful for sensitising cancer cells such as glioblastoma and leukaemia to an apoptotic stimulus (e.g. ultraviolet radiation, cancer chemotherapeutic drug (e.g. cisplatinum). The invention is useful for treating acquirted immune deficiency syndrome (AIDS), neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, epilepsy and ischaemia such as myocardial infarction and stroke. The present sequence is human bcl-x antisense oligonucleotide. This sequence is the analogue of ISIS 15999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compound useful for treating reduced apoptotic conditions e.g. cancer comprises nucleobases targeted to nucleic acid molecule encoding human

Detection of protein-protein interactions for screening compounds capable of modifying the interaction comprises observing intracellular localization of one protein after altering the modification pattern.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAH43465-67 are primers which were used to amplify the open reading frame of the mitochondrial cDNA clone HF03564. The protein encoded by the amplified sequence was used in the method of the invention. The method allows detection of interactions between a protein X and a protein Y which has a reporter function in eukaryotic cells, and comprises modifying the localization patterns of X and/or Y, and the localization of Y in the cell is observed using the reporter function. This method is useful for the elucidation of protein networks within the cell. It is also applicable for the discovery of new proteins and low-molecular drugs, by observing their effect on intracellular protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer 1 used to amplify human apoptosis inhibitory factor Bcl-xL cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primers AAV57313 and AAV57314 were used to amplify the human bcl-xL (cell death suppressing gene) gene isolated from a human cDNA library. After amplification, the product was cloned into the EcoR1 site of pBluescript, thus obtaining the plasmid pM21. This plasmid, was used in the construction of an expression vector which can then be used in the preparation of a stress-resistant plant, by introducing this gene into a plant cell and then using this cell to regenerate a plant. The stress-resistant plant but been found to show
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New stress-resistant transgenic plants, comprise cell death suppressing gene - used to confer resistance to stress caused by UV irradiation, super-oxide-generating herbicides or high salinity.

                                                                                                                                                                                             The invention relates to a novel random oligonucleotide having a base sequence where each base of the 1st and 2nd codon is any of G_1 (G_1 (U_1) or A and each base of the 3rd codon is G_2 or G_1 or G_2 or G_3 of the invention may be useful for preparing a random oligonucleotide preparation to be used for detecting protein interactions or for screening ligand or receptor protein binding sites. The current sequence is that of the PCR primer 1 of the invention which was used to amplify
                                                                                                       Random oligonuclectide useful for detecting protein interaction, having base sequence, where each base of 1st and 2nd of the codon is the any of G, C, T (U), or A and the base of 3rd of codon is G or G, or G or T (U).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New genetically engineered hamster or murine myeloma host cells comprising enhanced levels of active anti-apoptosis genes, useful for producing complex protein therapeutics.

Bcl-XL protein protects T-1ymphocytes against cell death, and bcl-XS is a dominant regulator. The amplified bcl-XS fragment has been cloned into NdeI and BamHI sites of plasmid pgr-3b, and expressed in BL21 cells, for use in generation of rabbit polyclonal antibodies and mouse monoclonal antibodies to monitor antibodies have submy that resting T-cells. Immunoassays using the antibodies have shown that resting T-cells do not express bcl-XL, whereas anti-CD3 activated T-cells express the protein, and expression levels are increased by anti-CD2 costimulation. The bcl-XL gene may be introduced into T-cells in vivo or ex vivo for HIV infection gene therapy of autoimmune disease, graft rejection or graft-versus-host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer; bcl-XS; PCR; polymerase chain reaction; bcl-XL; T-lymphocyte; activation; cell death; antibody; CD28 costimulation; gene therapy; HIV; AIDS; antisense; immune disorder; autoimmune disease; graft rejection; graft-versus-host disease; apoptosis; adoptive immunotherapy; ss.
marker gene and at least one gene of interest. The host cell of the invention may be useful for producing at least one protein encoded by a gene of interest. The DNA, polypeptide and the methods may be used for inhibiting or delaying cell death. The current sequence is that of the Chinese hamster anti-apoptosis bcl.xL-related PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing or preventing death of T cells by bcl-XL protein regulation used to increase survival of HIV infected cells or to down:regulate immune responses in immune diseases.
